METHODS

A PEGASUS Family Safety Argumentation Approach

23.09.2020

Roland Galbas, coordinator of VV-Methods project

(VV-Methods Co-Coordinated by Mark Schiementz)

Robert Bosch GmbH

VV-METHODS – Project Setup

- ▶ **Funded by** Ministry of Economics and Technology (BMWi)
- ▶ **Start, Runtime** 07/2019, 4 years
- ▶ **Budget total** 47M€
- ▶ **Partners**

OEM	
Tier-1	
Tech	
Eval	
Science	

Systematic control of test space

- ▶ Methods to optimize (and reduce) the test parameter space to a manageable minimum

$\infty \rightarrow n$

Industrial defined interfaces for systems and components

- ▶ Definition of incremental tests of subsystems and overall systems

Significant shift from real-world testing to simulation

- ▶ Methods for seamless testing across all test instances

$\infty \rightarrow n$

Goal I – Systematic control of test cases

- ▶ Understand relevant phenomena & traffic behaviors
- ▶ Involve traffic law perspective
- ▶ Approach a **nominal behavior**
- ▶ Identify **enveloping tests**

Criticality analysis

Safety assessment & safety concepts

Rules for system and test requirements

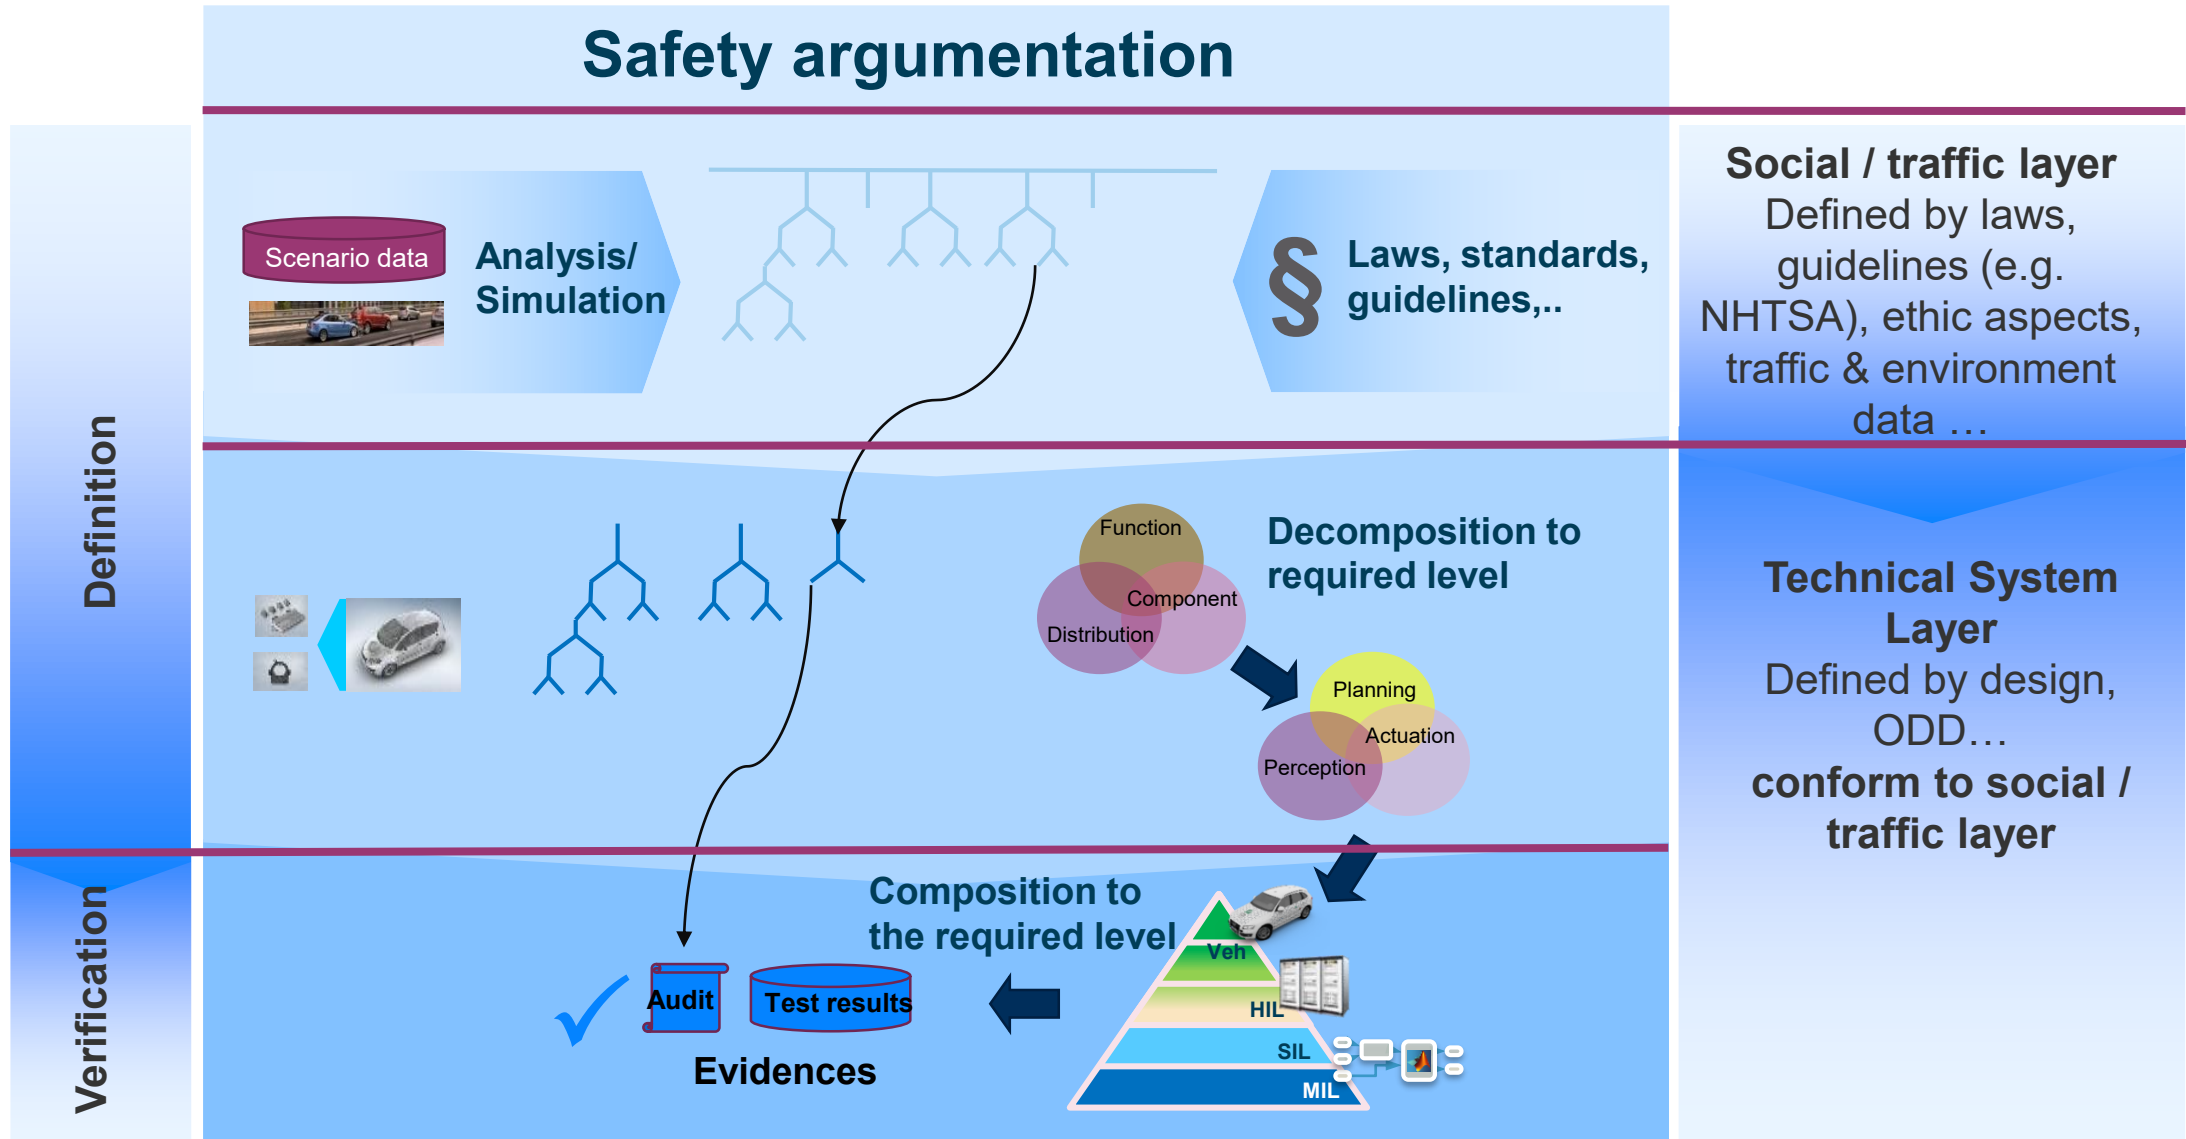

Goal II – Industrial interfaces

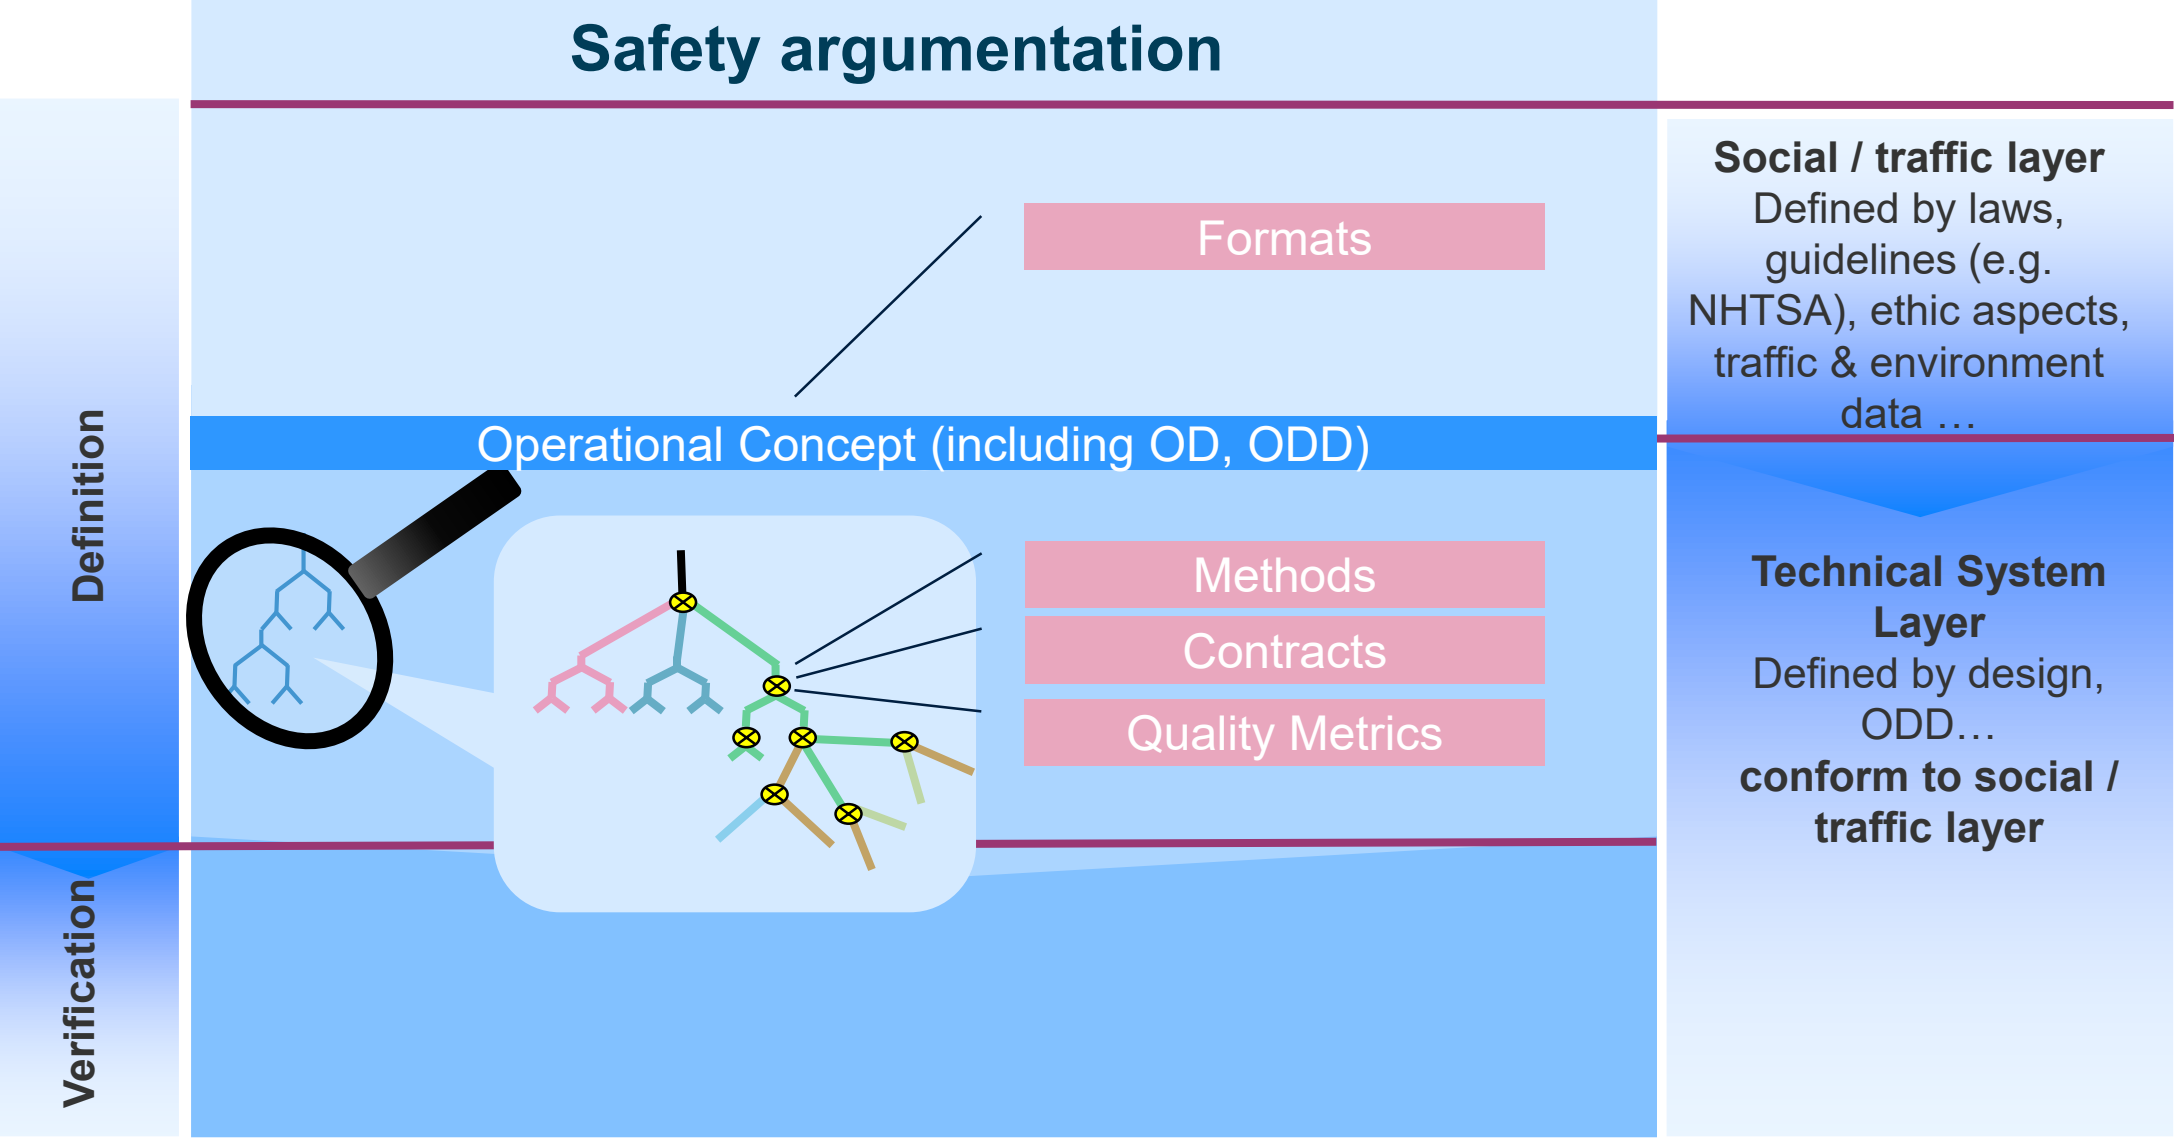

- ▶ Common methods for systematic breakdown of technical contracts, requirements & tests
- ▶ Agreed rules for **component exchange** between OEM and supplier
- ▶ Efficient **variant-release**, preservation of test-results of unmodified components
- ▶ Integration of **systems of different manufacturers**.

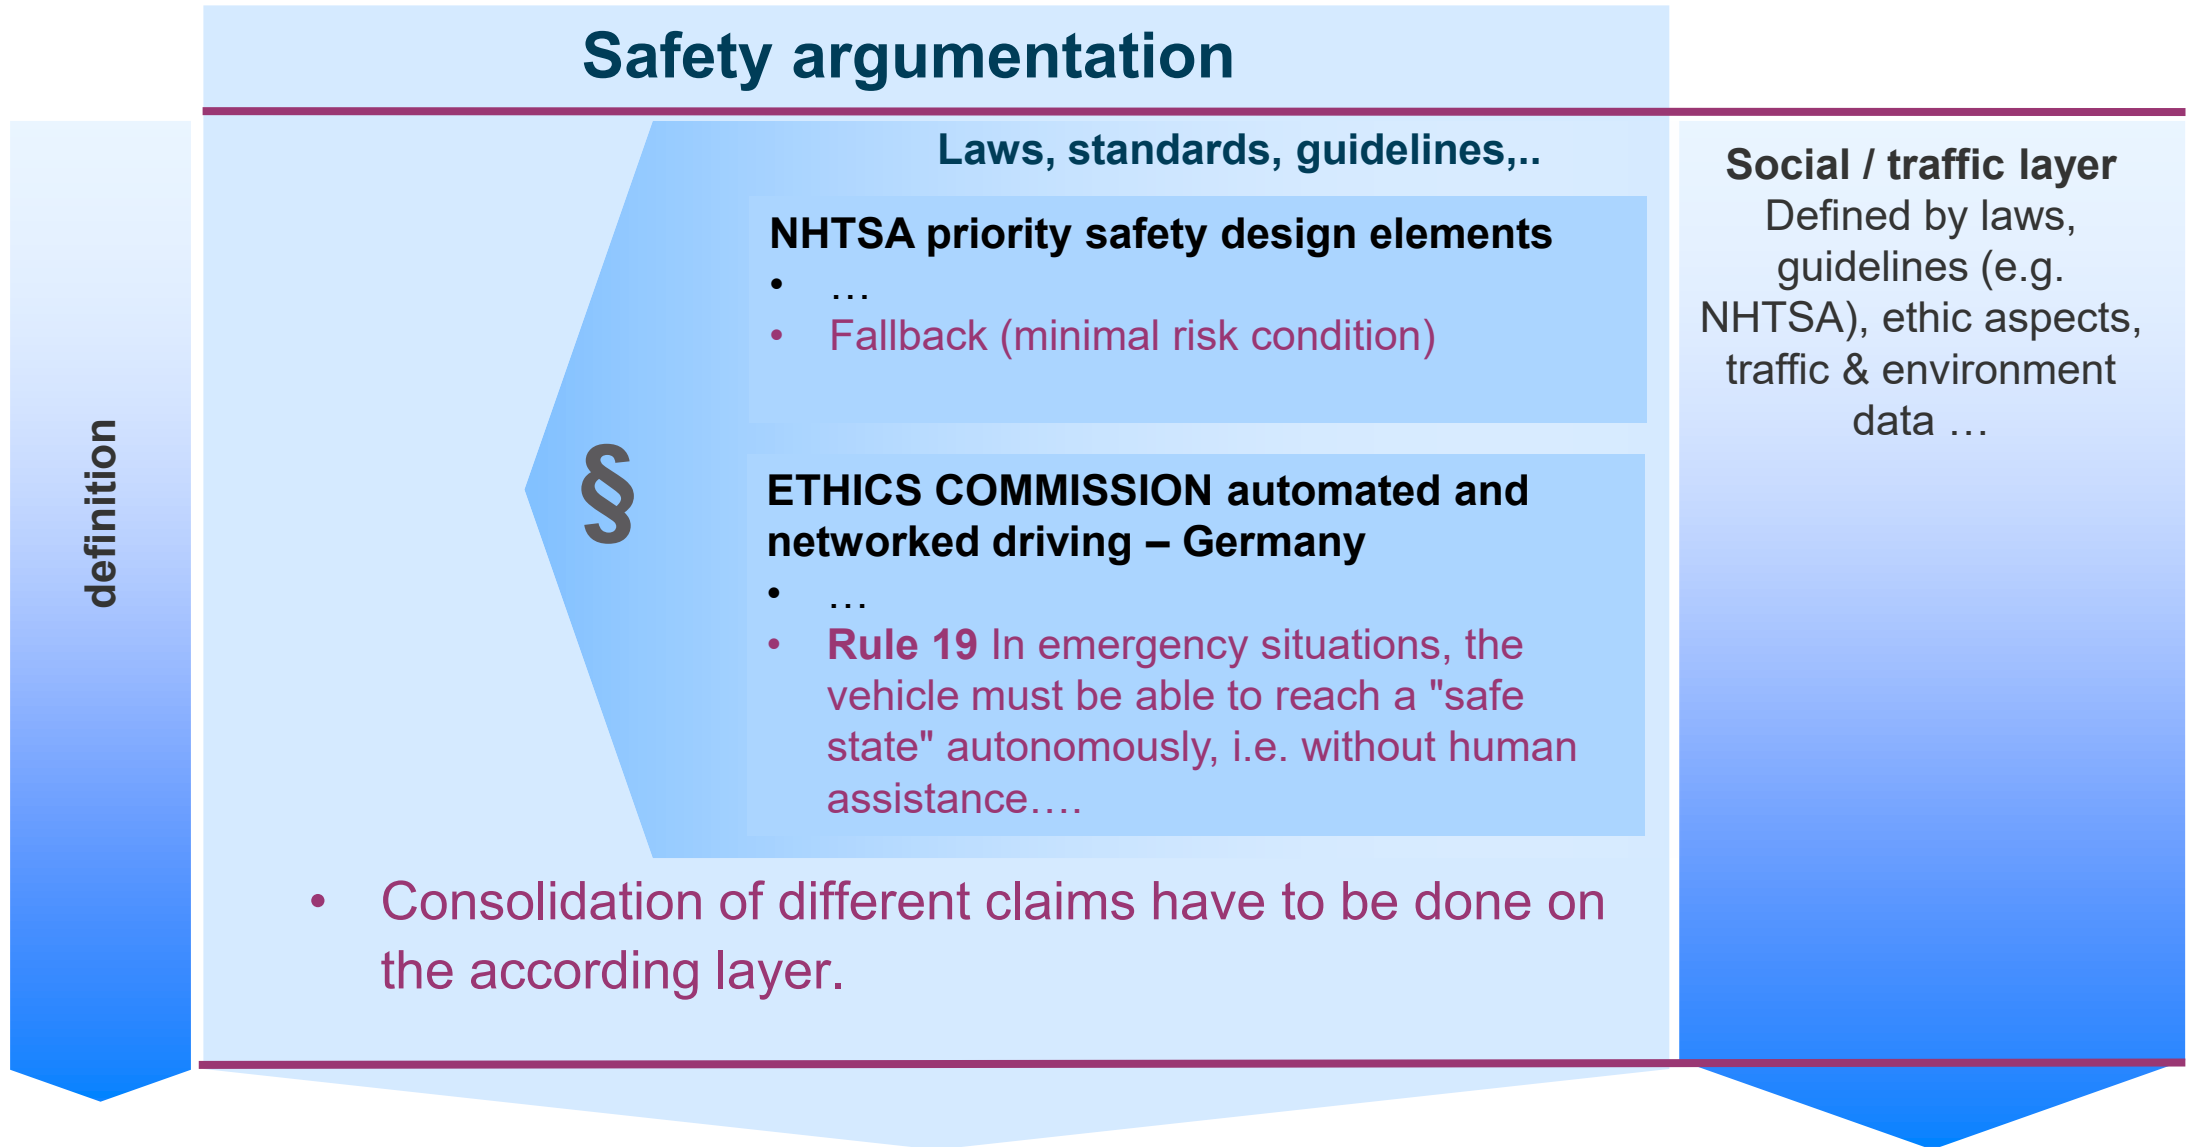

Goal III – shift to simulation

- ▶ Seamless use of virtual and real artefacts
- ▶ Efficient integration of simulation into the test-infrastructure with focus on
- ▶ **Seamless testing** across functional test infrastructures
- ▶ Efficient **distribution of test efforts** (Sim-Real).

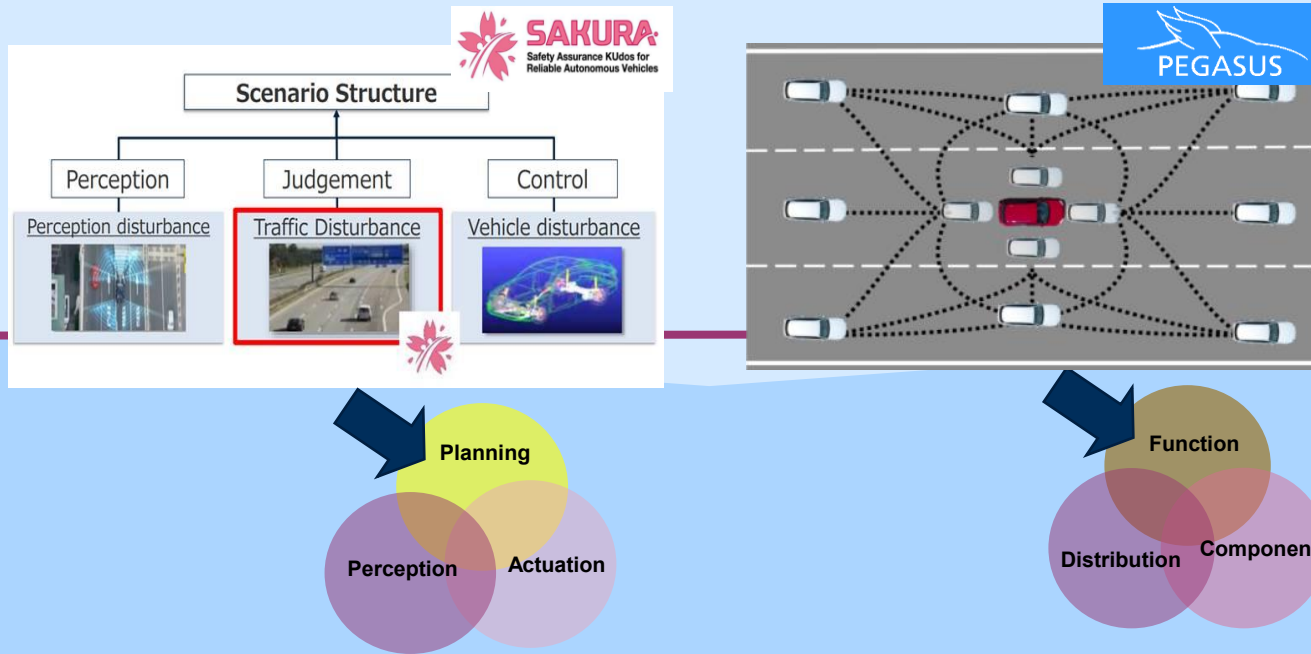

Safety argumentation

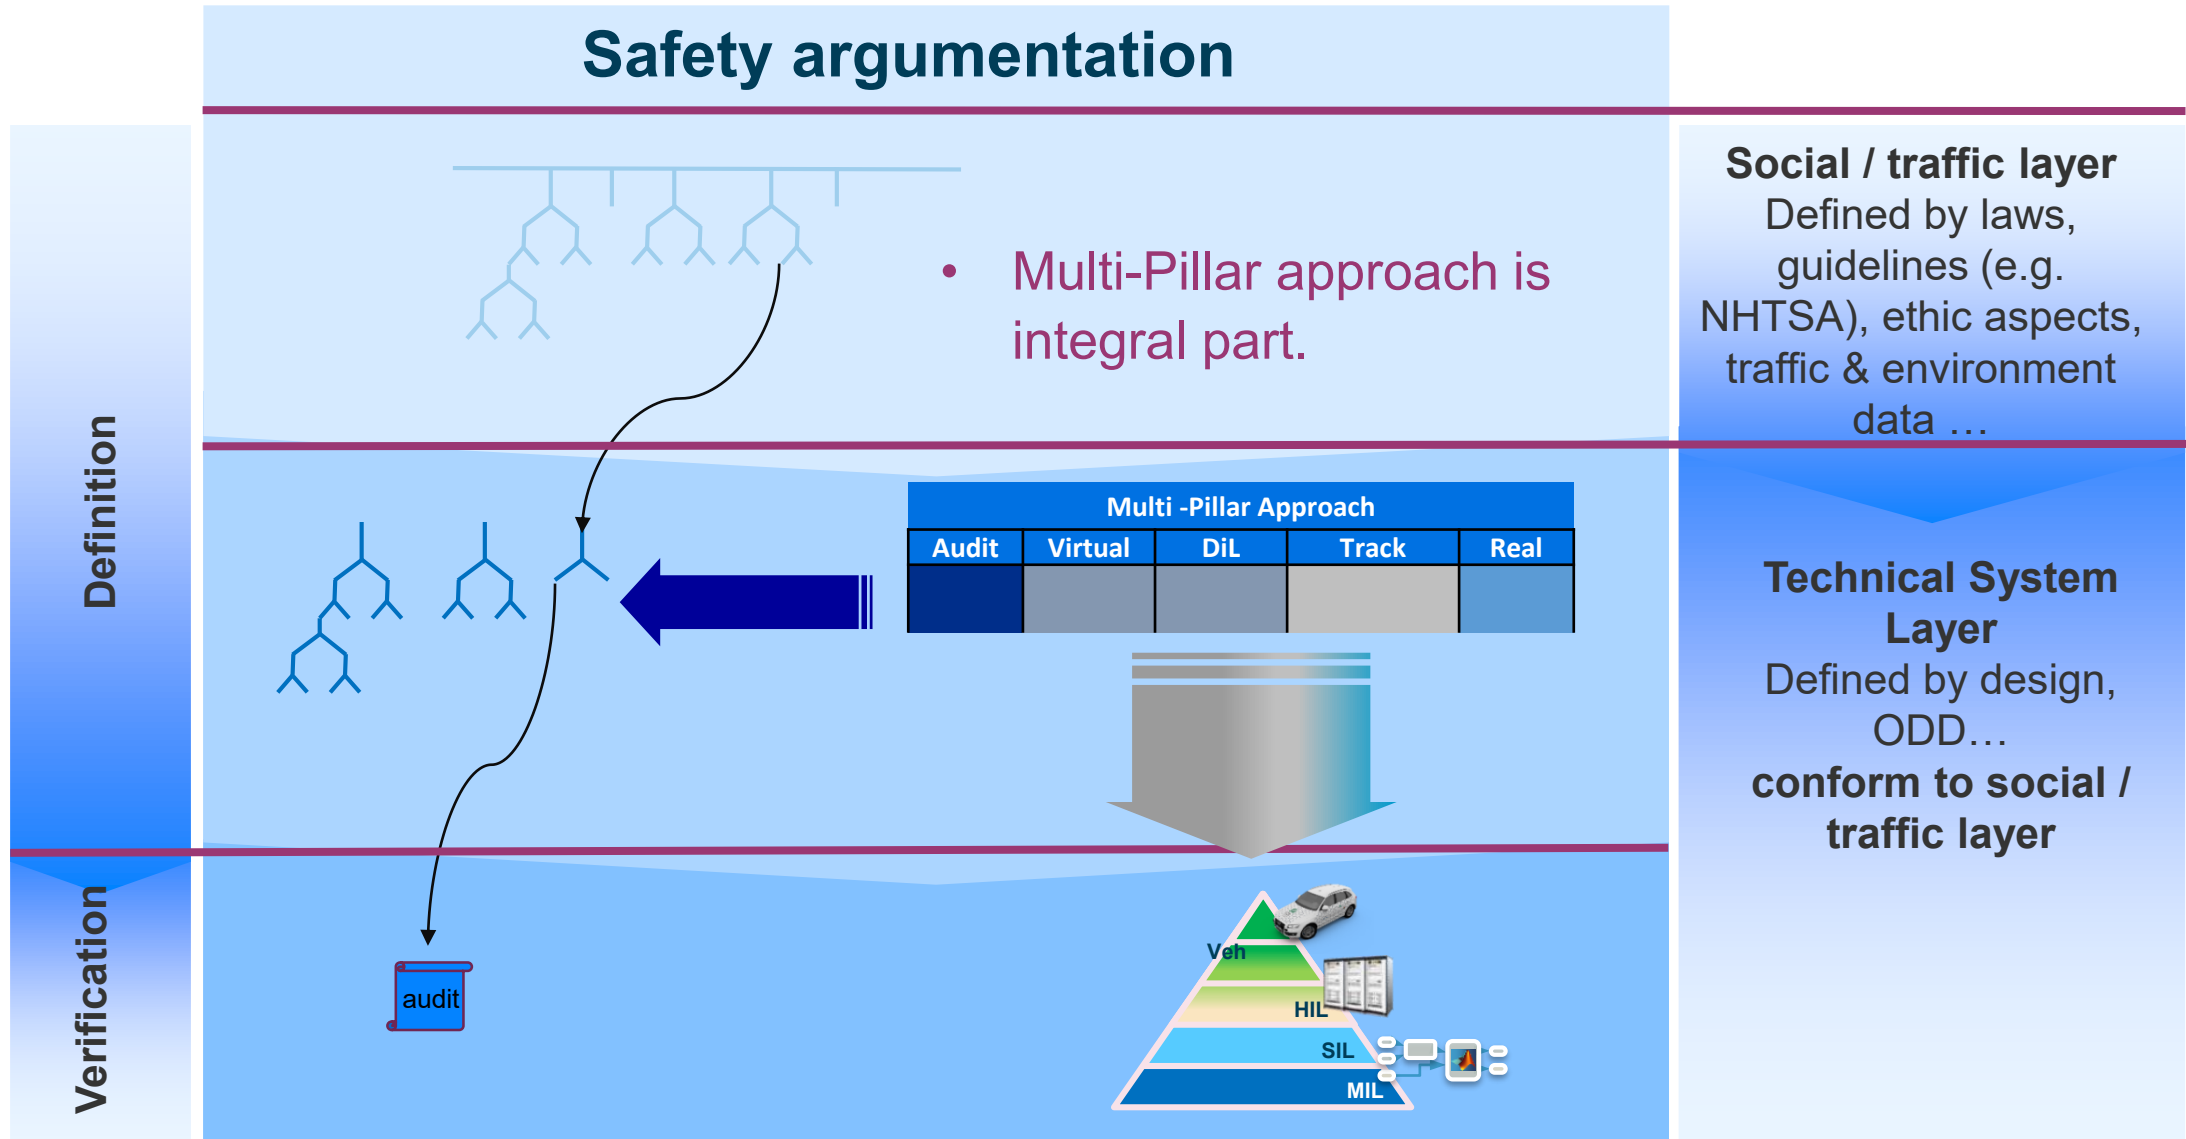

Definition

Social / traffic layer
 Defined by laws, guidelines (e.g. NHTSA), ethic aspects, traffic & environment data ...

Technical system layer
 defined by design, ODD...
conform to social / traffic layer

- Scenario based approach remain central element.
- Decomposition is core element of approach.

Why safety argumentation?

It is a systematic approach to the requirements flow. It enables and supports the project goals

- structuring the inputs of open world traffic behaviour and law perspective.
- enable the systematic breakdown of contracts.
- define quality-requirements to simulation.

What is needed?

- **Contracts** based on **assumptions and guaranties** define the safety argumentation – thus building up **industrial interfaces**.
- **Methods** for definition and brake-down of contracts.
- **Quality criteria and metrics** to define social and technical contracts
e.g. the **Positive Risk Balance** could be considered a quality criteria on a high level of the social layer.
- **Formats** e.g. the functional architecture as a structuring method for knowledge.

- ▶ **VV-Methods and SETLevel4to5 are successors of PEGASUS** and build on its results.
Main goal: Enabling and industrialization of AD system.
- ▶ **Safety Argumentation is main element and enabler**
 - ▶ Systematical flow of requirements – can be decomposed into 3 main layers.
 - ▶ Quality criteria and metrics are building the basis to define contracts within the safety argumentation.
- ▶ **Criticality Analysis** – Core element at the social / traffic layer of the safety argumentation
 - ▶ **Managing dilemma of completeness and condensation of test space**
- ▶ **Next steps**
 - ▶ Publication of Criticality Analysis in 2020
 - ▶ Further development of Phenomenon Signal Model, Ontology, overall method and safety metrics concept
